

RIG SERVICES

To help optimize the productive life of an oil or gas well, C&J operates a diversified fleet of more than 550 workover and well servicing rigs in every important oil and gas area in the U.S. and Canada. Designed specifically to extend production from existing wells, our rigs, which range from 200 to 900 horsepower, are utilized for the repair and maintenance of oil and gas wells, the completion of new wells and in shallow drilling operations. C&J also performs recompletion and redrilling operations and swabbing services, and, at the end of a well's life, plugging and abandonment.

We offer a wide range of rig service applications, including further drilling to complete a new producing reservoir, cleaning out and recompleting a well if production has declined and repairing leaks or converting a producing well to an injector for secondary or enhanced recovery projects. Our auxiliary offerings include power swivels, pumps, mud tanks, generator sets, blowout prevention equipment, frac tanks and a range of auxiliary equipment in many types and sizes required for maintenance, workover and completion applications.

Our Services

- Initial completion of new wells
- Recompletion of existing wells
- Redrilling of existing wells
- Lateral drilling and completion
- Mechanical tubing and casing repairs
- Swabbing services
- Plug and abandonment
- Fluid removal services
